Geo LAS Check

Windows installation and first run

Check LAS 2.0 well logs on your PC. The Windows download includes everything needed to run the program.

Extract and run

01 **Extract the download.** Right-click **GeoLASCheck.zip** and choose **Extract All**. Select a folder where you can save files, then click **Extract**.

02 **Add your LAS files.** Open the extracted **GeoLASCheck** folder. Copy the **.las** files you want to check into **input_files**.

03 **Open the program.** Double-click **GeoLASCheck.exe** in the extracted folder. In the console window, type the number next to the LAS file you want to check and press **Enter**.

04 **Choose whether to correct.** If the program offers **Correct? [y/N]**, type **y** and press **Enter** to save and recheck a corrected copy. Press **Enter** alone for the report only.

Find your files

input_files	Contains the LAS files you supply. Geo LAS Check leaves these originals intact.
output_files	Contains a folder named after each checked file, without the .las extension. Open that folder to find **summary.pdf** and, if a repair was applied, **<name>_corrected.las**.

For example, **example.las** produces **output_files\example\summary.pdf**.

If the PDF shows **REVIEW REQUIRED**, read the remaining findings before using the file.
